### Answer Guide

**a) Evaluate the profitability of each division and the MSP Ltd as a whole (group) under the current transfer pricing arrangement, and in light of the external supplier's offer to division P, AND discuss one problem that may arise for both Divisions if the transfer price remains at the current market price**

| Division's operating statement | S            | P            | MSP Ltd as a whole company |
|--------------------------------|--------------|--------------|----------------------------|
|                                | FRW(million) | FRW(million) | FRW(million)               |
| Sales (external)               | 504          | 840          | 1,344                      |
| Internal sales                 | 360          | -            | 360                        |
| Total Revenues                 | 864          | 840          | 1,704                      |
| less: Variable costs           |              |              |                            |
| Product S (transferred in)     | -            | -360         | -360                       |
| Other Materials                | -360         | -144         | -504                       |
| Direct Labor (FRW 480/hr)      | -115.2       | -72          | -187.2                     |
| Variable overhead              | -57.6        | -36          | -93.6                      |
| Selling & distribution costs   | -50.4        | -18          | -68.4                      |
| Total variable costs           | - 583.2      | -630         | -1,213.2                   |
| Total Contribution             | 280.8        | 210          | 490.8                      |
| less: Annual Fixed costs       | -48          | -18          | -66                        |
| Division Profit                | 232.8        | 192          | 424.8                      |
| Rank                           | 1            | 2            |                            |

**Note:** The total internal transfer price amounting to FRW 360 million is income to division S and a cost to division P. This cancels out at group level, so the group profit reflects only genuine external revenues and costs.

### **One problem that may arise for both Divisions if the transfer price remains at the current market price in light to the new external supplier offer to division P**

- Division P's problem:** Division P currently pays FRW 3,600 per kg to Division S at the full market price. A new external supplier now offers Product S at FRW 3,300 per kg which is FRW 300 cheaper. A rational divisional manager in Division P, evaluated on divisional profit, will prefer to buy externally as this reduces its cost and improves its own reported profitability. This creates pressure to bypass Division S entirely.
- Division S's problem:** If Division P switches to the external supplier, Division S loses 100,000 kg of internal transfers. Division S already sells its maximum external demand of 140,000 kg. It cannot redirect those 100,000 kg externally. The result is that Division S is left with significant idle capacity of 140,000 kg (along with the existing idle capacity of 40,000 kg) while continuing to bear fixed costs of FRW 48,000,000, severely damaging its profitability.

3. **Goal incongruence for the group:** What is rational for Division P (buy externally at FRW 3,300 per kg) is harmful to MSP Ltd as a whole. Division S's marginal cost of internal production is only FRW 1,680 per kg (see below), far below the external price of FRW 3,300. The group therefore loses value if Division P sources externally.

**b) Advise on the optimal production mix for division S between external sales of product S and internal transfers to division P given constraint of 320,000 available labor hours and transfer price.**

Using the standard transfer pricing principle:

Minimum TP (S's perspective) = Marginal cost of S + Opportunity cost

|                       |         |     |
|-----------------------|---------|-----|
| Labour hours per unit |         |     |
| Product S             | 480/480 | 1   |
| Product P             | 720/480 | 1.5 |

if labour hours available is 320,000 for both divisions,

|                              |              |
|------------------------------|--------------|
| <b>Total hours required</b>  | <b>Hours</b> |
| Division S external Sales    | 140,000      |
| Internal sales to Division P | 100,000      |
| Product P external Sales     | 150,000      |
| Total hours required         | 390,000      |
| Labour hours available       | 320,000      |
| Shortfall                    | 70,000       |

Unit contribution per labor hours (per unit of limiting factor)

|                                  |              |              |
|----------------------------------|--------------|--------------|
| Selling price (FRW)              | 3,600        | 8,400        |
| Less: Variable costs (FRW)       |              |              |
| Other Materials                  | 1,500        | 1,440        |
| Direct Labor (FRW 480/hr)        | 480          | 720          |
| Variable overhead                | 240          | 360          |
| Selling & distribution costs     | 360          | 180          |
| Material from S                  | -            | 3,600        |
| <b>Unit Contribution (FRW)</b>   | <b>1,020</b> | <b>2,100</b> |
| Labor hours per unit             | 1            | 1.5          |
| Unit contribution per labor hour | 1,020        | 1,400        |
| Rank                             | 2            | 1            |

**Production plan before decision to prioritize internal transfer**

|                              |                 |                       |                              |
|------------------------------|-----------------|-----------------------|------------------------------|
| <b>Production plan</b>       | <b>Quantity</b> | <b>Hours per unit</b> | <b>Total Hours allocated</b> |
| Produce P External sales     | 100,000 packs   | 1.5                   | 150,000                      |
| Produce S External sales     | 140,000 kg      | 1.0                   | 140,000                      |
| Produce S internal sales     | 30,000 kg       | 1                     | 30,000                       |
| <b>Total hours allocated</b> |                 |                       | <b>320,000</b>               |

**The remaining unit to transfer (100,000 kg-30,000kg)=70,000 Kg**

**We should sacrifice external sales units of product S to be able to deliver the required internal sales:**

|                            |                      |            |
|----------------------------|----------------------|------------|
| Total opportunity cost     | (FRW1,020*70,000 kg) | 71,400,000 |
| Opportunity cost per units | (71,400,000/100,000) | <b>714</b> |

**Transfer price= 2,580+714**

**Transfer price=3,294**

| <b>Optimal production Mix</b> |                 |              |                              |
|-------------------------------|-----------------|--------------|------------------------------|
| <b>Production plan</b>        | <b>Quantity</b> | <b>Hours</b> | <b>Total Hours allocated</b> |
| Produce P External sales      | 100,000         | 1.5          | 150,000                      |
| Produce S internal sales      | 100,000         | 1.0          | 100,000                      |
| Produce S external sales      | 70,000          | 1            | 70,000                       |
| <b>Total hours allocated</b>  |                 |              | <b>320,000</b>               |

**c) Assess the economic value added (EVA) of MSP Ltd**

| <b>Adjusted NOPAT</b>                     |                   |                            |
|-------------------------------------------|-------------------|----------------------------|
| <b>Description</b>                        | <b>Adjustment</b> | <b>Total (FRW 000,000)</b> |
| Profit Before Tax                         |                   | 3,889                      |

| 1                                                         | Equity             | 45            | 14                  | 6.3                  |
| 2                                                         | Debts              | 55            | 8.64                | 4.752                |
|                                                           | <b>Total</b>       |               |                     | <b>11.052</b>        |
| EVA=NOPAT-Capital Charge                                  |                    |               |                     |                      |
| EVA=4,139.28-(11.05%*49,987.64)= <b>-1,385.81 Million</b> |                    |               |                     |                      |

### Interpretation:

The non-executive director's suggestion to adopt EVA is fully justified. ROCE of 12.3% appears to beat the industry average of 11.8% creating a misleading impression of value creation.

However, EVA reveals that the true economic cost of capital (11.052% \* FRW ~49,988M) exceeds NOPAT by approximately FRW 1,386 million, confirming that MSP Ltd is destroying shareholder value. ROCE also encourages short-termism managers may reject positive NPV projects that dilute divisional ROCE. EVA aligns management behaviour with long-term value creation.

### **d) Corporate governance problems faced by MSP Ltd, and two specific governance reforms that MSP should implement immediately to address the concern raised by regulatory review.**

Issues with corporate governance in MSP Ltd and recommended reforms

**1. Dual Role of CEO and Chairman (CEO Duality):** Mr. Emmanuel Mugisha serves as both Chairman of the Board and Chief Executive Officer of MSP Ltd. This is a fundamental breach of good corporate governance, since the Chairman's role is to lead and oversee the board including holding the CEO to account while the CEO manages day-to-day operations. Combining both roles in one person eliminates this check and creates an unchecked concentration of power. The UK Corporate Governance Code and international best practice (including Rwanda's own guidelines) require these roles to be held by different individuals to ensure independent leadership of the board.

**2. Board Dominated by Family Members hence lack of Independence:** Five of the eight board members are close family relatives of Mr. Mugisha, and two are personal friends. This means seven of eight directors have personal relationships with the founder, creating serious conflicts of

interest and undermining the board's ability to challenge management objectively. Only one independent non-executive director (NED) exists. Corporate governance codes typically require a significant proportion of the board to be independent NEDs in MSP's case, the near-total absence of independence means the board cannot effectively scrutinise executive decisions, approve related-party transactions objectively, or protect minority shareholders.

**3. Board Composition Unchanged for 15 Years “Lack of Refreshment”:** The board has not changed since the company was founded fifteen years ago. Effective governance requires periodic board renewal to bring fresh perspectives, new skills, and updated knowledge. Long-tenured directors especially those with personal ties to the CEO risk becoming compliant and insufficiently critical. A nominations committee would normally manage the process of reviewing board composition and recommending new appointments, but no such committee exists at MSP Ltd.

**4. Absence of Board Sub-Committees:** MSP Ltd has no audit committee, no remuneration committee, and no nominations committee. These sub-committees are fundamental components of sound governance. An audit committee (composed of independent NEDs) would oversee financial reporting, internal controls, and the external audit relationship. A remuneration committee would ensure executive pay is set independently and fairly. Without these structures, all authority remains with the full board, which is itself dominated by the CEO's family, effectively meaning there is no independent check on executive remuneration or financial integrity.

**5. No Internal Audit Function:** A formal internal audit function has never been established at MSP Ltd. Internal audit provides independent assurance on the effectiveness of risk management, controls, and governance processes. Given that MSP is a sizeable company under regulatory scrutiny, the absence of internal audit leaves significant control risks unaddressed and makes it impossible to provide reliable assurance to the board and stakeholders.

**6. Undisclosed Related Party Transactions:** Reports indicate that transactions between MSP Ltd and businesses owned by family board members have not been properly disclosed in the financial statements. Related-party transactions are inherently high-risk and require full disclosure under both accounting standards (IAS 24) and corporate governance codes, to ensure shareholders and other stakeholders can assess whether such transactions were conducted at arm's length and in the company's best interests. Non-disclosure is a serious governance failure and potentially a legal violation.

**7. External Auditors Appointed Without Independent Oversight:** The external auditors are appointed directly by Mr. Mugisha without involvement of an audit committee or independent process. This undermines auditor independence one of the cornerstones of reliable financial reporting. An auditor appointed by and reporting to the same individual whose performance is being audited faces an obvious conflict of interest. Best practice requires auditor appointment to be managed by the audit committee and approved by shareholders.

**8. Concerns of Finance Director Dismissed:** The recently appointed Finance Director raised legitimate concerns about weak internal controls, lack of transparency in executive remuneration, and inadequate risk management. The fact that these concerns were dismissed by the majority board members illustrates that the board is not functioning as an effective oversight body.

Governance codes require boards to take such concerns seriously and investigate them through proper channels. Dismissal of the Finance Director's concerns increases the risk of financial misstatement and regulatory non-compliance.

### **Recommended Governance Reforms**

**1. Separate the Roles of Chairman and CEO:** MSP Ltd should immediately appoint an independent, non-executive Chairman to replace Mr. Mugisha in that role. Mr. Mugisha may continue as CEO, but the Chairman's position must be held by a different individual with no executive responsibilities and no personal relationship with the CEO. This single reform would go a long way toward restoring the board's independence and its ability to hold management accountable. The RDB's regulatory concerns would be directly addressed, and institutional investors/lenders who have made continued financing conditional on governance improvements would gain confidence.

**2. Establish an Audit Committee with Independent NEDs:** MSP Ltd should recruit at least two additional independent non-executive directors and constitute an Audit Committee chaired by one of them. This committee should take over responsibility for overseeing financial reporting, approving related-party transactions, reviewing the work of external auditors, and commissioning an internal audit function. This would directly address the issues of undisclosed related-party transactions, uncontrolled auditor appointment, and absence of internal audit all flagged by the RDB and the Finance Director.

| Total marks allocated |                                                                                                                                                                                                                                             | 25           |

## Model Answer

- a) Construct and evaluate a decision tree for KER's exploration decision. Clearly show all decision nodes, chance nodes, probabilities, expected values and the recommended course of action.

### Recommended course of action:

Commission the seismic survey (FRW 3million) and drill only if the survey returns a positive result. This yields the highest EV of FRW 8,493,000, which is FRW 6,333,000 better than drilling immediately and FRW 8,493,000 better than doing nothing. The seismic survey efficiently filters out the high-probability dry-well scenario before committing to expensive drilling.

### Workings:

- Drill immediately:  $EV = (60,000,000 \times 0.2) + (12,300,000 \times 0.8) = \text{FRW } 2,160,000$
- Seismic survey:

Positive result,  $EV = (60,000,000 \times 0.7) + (12,300,000 \times 0.3) = \text{FRW } 38,310,000$

Negative result,  $EV = (60,000,000 \times 0.014) + (12,300,000 \times 0.986) = \text{FRW } -11,287,800$

Note: When the survey returns a negative result, KER's optimal decision is not to drill therefore Expected Value (EV) will be  $0.7 \times 0 = 0$ , because drilling has a negative EV of FRW 11,287,800. In a decision tree, at a decision node you choose the best action so you take the 0, not the negative FRW 11,287,800.

- b) i) Advise on the most profitable customer to IBL ltd.

| Description            | Kigali Supermart | Nyamirambo Traders | Remera Wholesale Hub |
|------------------------|------------------|--------------------|----------------------|
| Contribution           | 17,100,000       | 5,700,000          | 11,400,000           |
| <b>Less: Overheads</b> |                  |                    |                      |
| Order processing       | 1,800,000        | 4,800,000          | 3,000,000            |
| Delivery               | 2,400,000        | 6,400,000          | 4,000,000            |
| Sales visits           | 960,000          | 2,560,000          | 1,600,000            |

| Description                       | Kigali Supermart | Nyamirambo Traders | Remera Wholesale Hub |
|-----------------------------------|------------------|--------------------|----------------------|
| Invoice and credit administration | 1,344,000        | 3,584,000          | 2,240,000            |
| Total overhead                    | <b>6,504,000</b> | <b>17,344,000</b>  | <b>10,840,000</b>    |
| Net Profit                        | 10,596,000       | - 11,644,000       | 560,000              |
| Rank                              | 1                | -                  | 2                    |

**Advise:** the most profitable customer is kigali supermart and second one is remera wholesale hub but nyamirambo traders is not profitable.

**Workings:cost per activity /cost driver rate and allocation**

| Activities                        | Cost Driver     | Cost Driver Rate | Kigali Supermart | Nyamirambo Traders | Remera Wholesale Hub |
|-----------------------------------|-----------------|------------------|------------------|--------------------|----------------------|
| Order processing                  | Orders placed   | 60,000           | 1,800,000        | 4,800,000          | 3,000,000            |
| Delivery                          | Deliveries made | 66,667           | 2,400,000        | 6,400,000          | 4,000,000            |
| Sales visits                      | Sales visits    | 160,000          | 960,000          | 2,560,000          | 1,600,000            |
| Invoice and credit administration | Invoices raised | 44,800           | 1,344,000        | 3,584,000          | 2,240,000            |

**Note:**

**Cost driver rate:**

- **Order processing:** 15Million/(250 Orders)=FRW 60,000 per order
- **Delivery:** 20 Million/(300 Deliveries)=FRW 66,667 per delivery

We have the case delivery rate, but we need to use the number of deliveries made. Therefore, we should multiply this rate by the number of cases sold to get the number of deliveries.

(4,500\*0.8%) for Kigali Supermart, (1,500\* 6.4%) for Nyamirambo Traders, and (3,000\* 2%) for Remera Wholesale Hub.

The number of deliveries will be 36, 96, and 60 for Kigali Supermart, Nyamirambo Traders, and Remera Wholesale Hub, respectively.

- **Sales visits:** 8 Million/(50 Deliveries)=FRW 160,000 per sales visit
- **Invoice and credit administration:** 11.2Million/(250 Deliveries)=FRW 44,800 per invoice

**Allocation to the customers:**

- **Order processing:** Kigali Supermart (60,000\*30), Nyamirambo Traders: (60,000\*80), Remera Wholesale Hub: (60,000\*50)
- **Delivery:** Kigali Supermart (66,667\*36), Nyamirambo Traders: (66,667\*96), Remera Wholesale Hub: (66,667\*60)
- **Sales visits:** Kigali Supermart (160,000\*6), Nyamirambo Traders: (160,000\*16), Remera Wholesale Hub: (160,000\*10)
- **Invoice and credit administration:** Kigali Supermart (44,800\*30), Nyamirambo Traders: (44,800\*80), Remera Wholesale Hub: (44,800\*50)

## ii) Key observation revealed by ABC Analysis

**1.Gross contribution margin is a misleading performance indicator:** Under IBL's current reporting system, all three customers appear equally profitable at the gross profit level each carries an identical gross margin of 42%. This gives management no basis for distinguishing between customers and might suggest that Kigali Supermart, as the highest-revenue customer, is the most valuable. The ABC analysis completely overturns this picture. Once customer-driven overheads are properly attributed, the true net profitability of each customer is revealed.

Kigali Supermart is highly profitable (FRW 10,596,000; 26% net margin), Remera Wholesale is marginally Profit-making (FRW 560,000; 2%) and Nyamirambo Traders is severely loss-making (FRW-11,644,000; -86%). The current system actively conceals this information from management.

**2.Customer behaviour (not sales volume) drives profitability:** The ABC analysis shows that Nyamirambo Traders places 80 orders per year to purchase only 1,500 cases. This means an average order size of fewer than 19 cases per order. In contrast, Kigali Supermart places only 30 orders to purchase 4,500 cases an average of 150 cases per order. The cost consequence is dramatic

Nyamirambo consumes FRW 17,344,000 in customer-related overhead to generate only Rwf 5,700,000 in gross profit a net overhead deficit of FRW 11,644,000. Nyamirambo demands frequent deliveries, numerous sales visits and high invoice volumes out of all proportion to its revenue contribution. This is the key observation of customer profitability analysis: the cost of serving a customer depends on how that customer behaves, not simply how much they buy.

**3.Nyamirambo traders portfolio is loss-making:** When ABC overhead is fully allocated, the combined net loss from the three main customers is FRW 488,000, despite total revenue of FRW 81,000,000. This means IBL is currently subsidising loss-making customer behaviour. Without this analysis, the company could continue investing resources in relationships that are destroying value, under the mistaken belief that high revenue equals profitability.

### Recommended Actions

#### 1.Restructure the terms of the relationship with Nyamirambo Traders

Nyamirambo Traders is loss-making by FRW -11,644,000 a net margin of -86%. This is not a minor inefficiency; the overhead cost of serving this customer is more than four times its gross profit contribution. IBL should immediately open commercial negotiations with Nyamirambo to restructure the relationship.

#### Specific measures could include:

- (a) introducing a minimum order quantity (for example, no orders below 60 cases) to reduce the number of orders, deliveries and invoices;
- (b) introducing delivery extras for small or non-standard deliveries to recover incremental costs or
- (c) reducing the frequency of sales visits given the low revenue generated. If Nyamirambo refuses to adapt its ordering behaviour and the terms cannot be renegotiated to a break-even or profitable level, IBL Ltd should seriously consider terminating the relationship to avoid continued value destruction.

#### 2.Use ABC data to negotiate pricing and set minimum order policies across all customers

IBL should use the ABC cost driver rates identified in this analysis to inform its commercial pricing and service policies going forward. For example, the cost per delivery is FRW 66,667. This means that a

customer requesting a delivery of fewer than approximately 21 cases (i.e. FRW 66,667/ FRW3,800 contribution per case) generates a delivery cost that exceeds the gross contribution from that delivery before any other overhead is considered.

IBL Ltd should insert these rates into its sales and pricing framework, making it clear that small, frequent orders carry real cost consequences. The company may also wish to offer incentives such as volume discounts or extended credit to customers who consolidate orders, since this directly reduces the overhead cost to serve and improves customer profitability without reducing revenue.

### QUESTION THREE

#### Marking Guide

| Sub qn                       | Description of marks allocation                                                                                                                                                                       | Marks     |

| <b>Total marks allocated</b> |                                                                                                                                                                                                       | <b>25</b> |

**Model answer****a) Variances for NPL for the year ended 2025**

|                                                                                   |
|-----------------------------------------------------------------------------------|
| i. sales price variance                                                           |
| (Budgeted price-Actual Price)*Actual Quantity Sold                                |
| (7,800-7,000)*490,000=392 million Adverse                                         |
| ii. Sales volume variance                                                         |
| (Budgeted Quantity-Actual Quantity)*Std Contribution                              |
| (500,000-490,000)*1,400=14 million Adverse                                        |
| Total sales variance=406,000,000 Adverse                                          |
| iii. Market size variance                                                         |
| (Actual market size-Expected market size)*Budgeted market share*Std profit margin |
| (1,750,000-2,000,000)*25%*1,400=FRW 87,500,000 Adverse                            |
| iv. Market share variance                                                         |
| (Actual market share-Budgeted market share)*Actual market size*std profit margin  |
| (28%-25%)*1,750,000*1,400= FRW 73,500,000 Favourable                              |

|                            | Budget    | Actual    |
|----------------------------|-----------|-----------|
| Total market size (litres) | 2,000,000 | 1,750,000 |
| NPL sales volume (litres)  | 500,000   | 490,000   |
| Market share %             | 0.25      | 0.28      |

|                              |        |         |
|------------------------------|--------|---------|
| <b>Standard contribution</b> |        | FRW     |
| Sales per bucket             |        | 7,800   |
| Titanium Dioxide             | 12,000 | 120,000 |
| Acrylic Resin                | 6,000  | 90,000  |
| Solvent / Water              | 2,000  | 40,000  |
| Additives                    | 14,000 | 70,000  |
| Total costs for 50 buckets   |        | 320,000 |
| No of buckets                |        | 50      |
| Standard Variable costs      |        | 6,400   |
| Standard Contribution        |        | 1,400   |

**b)**

**i) Advise the NPL Blend Division on the optimal output level and selling price for Greige that maximize profit, and quantify the corresponding maximum monthly profit.**

**Determination of marginal cost**

|                                                                  |            |
|------------------------------------------------------------------|------------|
| <b>Total Variable cost (marginal cost)</b>                       | <b>FRW</b> |
| Raw materials (Acrylic, Vinyl-Acrylic Resins (Binders) and Water | 320        |
| Packaging materials                                              | 80         |
| Direct labor                                                     | 150        |
| Variable factory overhead                                        | 50         |
| <b>Marginal cost (MC) per bucket</b>                             | <b>600</b> |

**Derive marginal revenue (MR) from demand Function**

$$P = 2,400 - 3Q \quad (Q \text{ in Thousands of buckets per month})$$

$$\text{Total Revenue} = P \times Q$$

$$TR = (2400 - 3Q) \times Q$$

$$TR = 2400Q - 3Q^2$$

The marginal revenue will be given by the differentiation of the total revenue function:

$$\text{Marginal revenue} = MR = dTR/dQ = 2400 - 6Q$$

**Profit maximization function**

$$MR = MC$$

$$2400 - 6Q = 600$$

$$6Q = 1,800$$

$$Q = 300 \text{ Buckets per month or } 300,000 \text{ buckets per month}$$

substitute Q into demand function to find optimal price

$$P = 2,400 - (3 \times 300) = 2,400 - 900$$

$$P = \text{FRW } 1,500 \text{ Per Bucket}$$

| Monthly profit statement                         | FRW (Million) |
|--------------------------------------------------|---------------|
| Revenues (1,500*300,000 Buckets)                 | 450           |
| Less: Total Variable costs (600*300,000 Buckets) | 180           |
| Contribution                                     | 270           |
| Less: Fixed production overhead                  | 18            |
| Less: Fixed selling & admin overhead             | 6.5           |
| Monthly profit                                   | 245.5         |

ii)

**The selling price and monthly profit under the current mark-up pricing policy (35% on total variable cost) and compare with (i) assuming the division produces at the same quantity as in (b)(i).**

|                                      |     |
|--------------------------------------|-----|
| Total variable cost per bucket (FRW) | 600 |
| Add: Mark-up (FRW)                   | 210 |
| Cost plus selling price (FRW)        | 810 |

| Monthly profit statement             | FRW (Million) |
|--------------------------------------|---------------|
| Revenue                              | 243           |
| Less: Total Variable costs           | 180           |
| Contribution Margin                  | 63            |
| Less: Fixed production overhead      | 18            |
| Less: Fixed selling & admin overhead | 6.5           |
| Monthly Profit                       | 38.5          |

**Comment: comparison**

Profit-maximising price (FRW 1,500): Monthly profit = FRW 245,500,000

Cost-plus price (FRW 810): Monthly profit = FRW 38,500,000

Additional Profit from MR=MC approach: FRW 207,000,000 per month

**c) The difference between corporate objectives and unit objectives, and discuss two reasons why unit objectives may conflict with the corporate objectives of NPL.**

- ✓ Corporate objectives are the overarching, long-term goals of the organisation as a whole. They reflect the interests of all stakeholders shareholders, customers, employees and society and guide strategic direction across every part of the business.
- ✓ Unit objectives are the shorter-term, operational targets set for individual SBUs or divisions. They typically focus on measurable financial metrics such as divisional profit, cost reduction, or return on investment that are within the direct control of division managers.

**Reasons why unit objectives may conflict with the corporate objectives of NPL**

1. Profit Maximisation at Divisional Level vs Overall Company Profit: the division manager is often evaluated based on divisional profit. As a result, the manager may make decisions that improve the division's results even if they reduce the profitability of the company as a whole.

2. Short-Term Divisional Targets vs Long-Term Corporate Strategy: Unit objectives usually focus on short-term measurable targets such as monthly profit, cost reduction, or ROI. Corporate objectives, however, often involve long-term strategic goals such as market development, product quality, or customer relationships.

**QUESTION FOUR**

**Marking Guide**

| <b>Sub question</b> | <b>Description of marks allocation</b>                                                                                                                                                     | <b>Marks</b> |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| <b>a</b>            | Advise Mr. Pacifique Ndayisaba on the most economically optimal time to undertake the replacement and determine the Net Present Value of the opportunity cost arising from wrong decision. |              |
|                     | Site rental income for each option: Award max 1 Mark for a well-calculated figure                                                                                                          | 2            |
|                     | Residual (disposal) value for each option: Award max 1 Mark for a well-calculated figure for option one and option 2 Award 0.5 Mark for a well-calculated figure                           | 1.5          |
|                     | Cost of a new generator unit for option one (replace every year): Award max 1 Mark for a well-calculated figure                                                                            | 1            |
|                     | fuel, lubricants, monitoring costs for each option: Award max 1 Mark for a well-calculated figure                                                                                          | 2            |
|                     | Maintenance & Repair Costs for each option: Award max 1 Mark for a well-calculated figure                                                                                                  | 2            |
|                     | PV of Net Cashflows for each option: Award max 1 Mark for a well-calculated figure                                                                                                         | 2            |
|                     | NPV for each option: Award max 0.5 Mark for a well-calculated figure                                                                                                                       | 1            |
|                     | NPV of opportunity cost of wrong decision                                                                                                                                                  | 0.5          |
| <b>b</b>            | Evaluate the expenditure budget for kanombe healthcare trust for the year ending 30th June 2026 (Award max 1 Mark for a well-calculated expenditure line figure)                           |              |
|                     | Staff salaries: Award max 1 Mark for a well-calculated figure                                                                                                                              | 1            |
|                     | Workings:                                                                                                                                                                                  |              |
|                     | Adjusted recurring salary base: Award max 0.5 Mark for a well-calculated figure                                                                                                            | 0.5          |

Annual replacement should be considered and the Ruhande telecom ltd would forego FRW 3,889,966 if it incorrectly choose to retain each generator for five years rather than replacing it annually.

➤ Opportunity Costs of wrong Decision is FRW 3,889,966

Workings:

| No specific adjustments required. Standard inflation applied to previous year actual figure: |  |

| Item                | Calculation | FRW '000 |
|---------------------|-------------|----------|
| Administration & IT | 22,000*1.03 | 22,660   |
| Community outreach  | 9,000 *1.03 | 9,270    |

**c) The impact of automation to the client and how it may affect KHT&RTI's performance management**

**1. Internet of Things and Real-Time Data Collection:** Relevance to Ruhande: Internet of Things sensors installed on each generator can capture real-time data on fuel consumption, operating temperature, voltage output and maintenance alerts. This transforms performance measurement from periodic manual checks to continuous monitoring. Site-level dashboards would allow Mr. Ndayisaba to monitor the financial performance of every generator across the country in real time, providing far richer data to support future replacement cycle decisions than historical averages alone.

**Relevance to KHT:** Internet of Things monitoring of clinical equipment (cold chain storage, medical devices) would enable condition-based maintenance scheduling, helping KHT avoid the emergency repair expenditure (e.g. the FRW11m roof repair) that distorted this year's budget by providing early warning of deterioration.

**2. Process Automation:** Mr. Habimana's current budgeting process is entirely manual and dependent on a single individual. The company can automate routine processes such as extracting prior-year actuals, applying inflation factors, flagging non-recurring items, consolidating budget lines and generating variance reports. This would reduce the risk of the type of errors identified in this year's budget and free Mr. Habimana for higher-value analytical and strategic work.

**On side of Ruhande:** Automated invoice processing, lease income reconciliation and maintenance cost tracking across multiple tower sites would reduce administrative overhead and eliminate manual data entry errors as Ruhande's asset base grows.

**3. Big Data Analytics and Predictive Modelling:** **Ruhande:** Historical operational data from generators across all sites can be used to build predictive maintenance models that identify the exact point at which each unit's failure probability and cost profile make replacement optimal. This would add quantitative rigour to future replacement decisions and allow Ruhande to move beyond periodic NPV analysis toward dynamic, data-driven asset lifecycle management.

On the other hand

Analysis of historical expenditure patterns of KHT, donor funding cycles and patient demand data would allow KHT to build evidence-based budgets grounded in operational reality, rather than simple incremental adjustments that ignore structural changes in cost drivers.

**4. Cloud-Based Enterprise Resource Planning (ERP) Systems:** Both organisations currently produce financial reports that are delayed, incomplete or insufficiently scrutinised. Cloud-based ERP systems provide a single integrated data environment where financial and non-financial data is updated continuously and accessible to authorised users anywhere. For KHT, the board of trustees could access live budget-versus-actual reports at any time, enabling governance challenges that are currently absent. For Ruhande, real-time site-by-site financial reporting would allow Mr. Ndayisaba to monitor generator profitability, track lease income receipt and manage operating costs actively throughout his remaining tenure.

**5. Artificial Intelligence (AI) and Machine Learning:** AI-driven forecasting tools can identify patterns in historical data to produce more accurate projections of income and expenditure, reducing dependence on simple inflation-rate adjustments. For KHT, AI could distinguish between genuinely demand-driven expenditure lines and those that reflect budget padding or non-recurring

events -- directly addressing the weaknesses in Mr. Habimana's incremental approach identified in Part (b)(ii). For Ruhande, machine learning models could predict generator failure probabilities at each site, enabling smarter capital allocation decisions across the fleet.

**6. Balanced Scorecard and Integrated Reporting Enabled by IT:** The availability of large volumes of real-time operational, financial and non-financial data makes it practical for both organisations to implement a Balanced Scorecard (BSC) or integrated performance measurement framework. Ruhande could track performance across financial (NPV per site), customer (uptime percentage for the telecom operator), internal process (maintenance response times) and learning perspectives (staff technical competency). KHT could measure clinical outcomes per district, cost per patient served, donor satisfaction scores and staff training completion. Neither organisation currently measures performance beyond financial expenditure.

**Note:** Both clients should be aware of the risks associated with IT investment: significant upfront capital cost, cybersecurity vulnerabilities, data governance requirements, and the need for staff capability development. A phased implementation approach is recommended, prioritising the highest-impact applications (real-time monitoring for Ruhande; automated budgeting for KHT) before progressing to more complex systems.

**End of Model Answer and Marking Guide.**
